

Give them, what they need the most!

The advantages of multidisciplinary management of chronic pelvic pain

- Chronic pelvic pain is common, complicated & often convoluted
- Focused multidisciplinary management is superior
- But it's a hassle to organize MDTs and to keep them running
- So, are the patients significantly more satisfied with the MDTs' work and effect?
- **We have asked 300 of them about their MDT experience vs the unidisciplinary HCP service**

We gave them more **time** to discuss their pain (71% vs 63%)

We treated them with more **empathy** (77% vs 36%)

We were more likely to identify the **origin** of the pain (53% vs 15%)

We were more likely to offer an **acceptable solution** for their pain (65% vs 46%)

The management we offered was better (to **ease** the pain) (42% vs 14%)

*But even as we failed to successfully manage the pain in about 60% of our patients **95% were still satisfied** with our work and 92% felt that it is better to be treated by MDTs than unidisciplinary HCPs...*
